

## Remote UAV Attacks & Disruption of Their Operation

### Vision Statement

Who among us has not seen a UAV (UAV, commonly known as a drone), or controlled a drone after ordering it online from e-Bay?

Until about a decade ago, UAV's were the domain of military and security officials alongside event photographers. However, recently they become more fertile ground for annoying elements who photograph other people's balconies without permission, terrorist elements are use them to send explosives in the air, alongside a positive and an effective use for transferring various products between people, especially in the Corona period when people rarely leave their homes.

Either way, the use of drones is expanding more and more, and there is a growing need to take over drones and disrupt them while they are in the air, immediately, usually for security reasons. (For example, a hostile drone in the state border area)

Our product, the **UVA-Jammer**, will change the existing situation on the ground, by providing a protective tool and disabling drones remotely, which could, among other things, be used by the public to protect their privacy from snoopers at a fair price. (Subject to state laws)
